# 1 Introduction

The Exchange Server Protocols Master Property List provides implementers with a single source of information about all the properties that are described by the specifications that comprise the Exchange Server Protocols documentation. If a property is not described by the specifications included in the Exchange Server Protocols documentation, it is not included in this document.

The criteria for including a property in the Exchange Server Protocols documentation are that it is set by a client in order to affect server behavior, or that it is set by a server in order to affect client behavior. Properties that are merely stored by the server on behalf of the client, or generated by the server for its own use and ignored by the client, are not necessarily documented. As a result, the properties that are included in the Exchange Server Protocols documentation, and therefore this document, are the critical **Message object** properties used for communication between clients and servers.

This document provides implementers with a convenient catalog of all these critical properties, a source of navigation to the individual technical specifications that describe these properties in detail, and a resource for additional helpful property information that is unique to this document.

Sections 1.7 and 2 of this specification are normative. All other sections and examples in this specification are informative.

## 1.1 Glossary

This document uses the following terms:

**8.3 name:** A file name string restricted in length to 12 characters that includes a base name of up to eight characters, one character for a period, and up to three characters for a file name extension. For more information on 8.3 file names, see [\[MS-CIFS\]](#) section 2.2.1.1.1.

**action:** A discrete operation that is executed on an incoming **Message object** when all conditions in the same **rule** are TRUE. A rule contains one or more actions.

**address book container:** An **Address Book object** that describes an **address list**.

**Address Book object:** An entity in an address book that contains a set of attributes, each attribute with a set of associated values.

**address list:** A collection of distinct **Address Book objects**.

**address type:** An identifier for the type of email address, such as **SMTP** and EX.

**alias:** An alternate name that can be used to reference an object or element.

**ambiguous name resolution (ANR):** A search algorithm that permits a client to search multiple naming-related attributes (2) on objects by way of a single clause of the form "(anr=value)" in a Lightweight Directory Access Protocol (LDAP) search filter. This permits a client to query for an object when the client possesses some identifying material related to the object but does not know which attribute of the object contains that identifying material.

**Appointment object:** A **Calendar object** that has an organizer but no attendees.

**archive tag:** An element that contains information about the archive policy of a **Message object** or folder.

**Attachment object:** A set of properties that represents a file, **Message object**, or structured storage that is attached to a Message object and is visible through the attachments table for a Message object.

**Augmented Backus-Naur Form (ABNF):** A modified version of Backus-Naur Form (BNF), commonly used by Internet specifications. ABNF notation balances compactness and simplicity with reasonable representational power. ABNF differs from standard BNF in its definitions and uses of naming rules, repetition, alternatives, order-independence, and value ranges. For more information, see [\[RFC5234\]](#).

**blind carbon copy (Bcc) recipient:** An addressee on a **Message object** that is not visible to recipients of the Message object.

**body part:** A part of an Internet message, as described in [\[RFC2045\]](#).

**calendar:** A date range that shows availability, **meetings**, and appointments for one or more users or **resources**. See also **Calendar object**.

**Calendar folder:** A **Folder object** that contains **Calendar objects**.

**Calendar object:** A **Message object** that represents an event, which can be a one-time event or a recurring event. The Calendar object includes properties that specify event details such as description, organizer, date and time, and status.

**carbon copy (Cc) recipient:** An address on a **Message object** that is visible to recipients of the Message object but is not necessarily expected to take any action.

**class:** User-defined binary data that is associated with a key.

**common name (CN):** A string attribute of a certificate (1) that is one component of a **distinguished name (DN)**. In Microsoft Enterprise uses, a CN must be unique within the forest where it is defined and any forests that share trust with the defining forest. The website or email address of the certificate owner is often used as a common name. Client applications often refer to a certification authority (CA) by the CN of its signing certificate.

**contact:** A person, company, or other entity that is stored in a directory and is associated with one or more unique identifiers and attributes (2), such as an Internet message address or login name.

**contents table:** A Table object whose rows represent the **Message objects** that are contained in a **Folder object**.

**conversation:** A single representation of a send/response series of email messages. A conversation appears in the Inbox as one unit and allows the user to view and read the series of related email messages in a single effort.

**conversation action:** A limited set of actions that a user applies to all **Message objects** that have the same PidTagConversationId value. The action is applied to all Message objects that are currently in the store or are delivered in the future.

**Coordinated Universal Time (UTC):** A high-precision atomic time standard that approximately tracks Universal Time (UT). It is the basis for legal, civil time all over the Earth. Time zones around the world are expressed as positive and negative offsets from UTC. In this role, it is also referred to as Zulu time (Z) and Greenwich Mean Time (GMT). In these specifications, all references to UTC refer to the time at UTC-0 (or GMT).

**counter proposal:** A request that an attendee sends to an **organizer** when requesting a change to the date or time of a meeting.

**cyclic redundancy check (CRC):** An algorithm used to produce a checksum (a small, fixed number of bits) against a block of data, such as a packet of network traffic or a block of a computer file. The CRC is a broad class of functions used to detect errors after transmission or storage. A CRC is designed to catch random errors, as opposed to intentional errors. If errors

might be introduced by a motivated and intelligent adversary, a cryptographic hash function should be used instead.

**Deferred Action Message (DAM):** A hidden message indicating to a client that it needs to execute one or more **rules** on another user-visible message in the store.

**delegate:** A user or resource that has permissions to act on behalf of another user or resource.

**delivery receipt:** A report message that is generated and sent by a client or server to the sender of a message or another designated recipient when an email message is received by an intended recipient.

**Department object:** An **Address Book object** that describes a department within an organization.

**departmental group:** A **distribution list** that describes a department within an organization.

**display name:** A text string that is used to identify a principal or other object in the user interface. Also referred to as title.

**display template:** A template that describes how to display or allow a user to modify information about an **Address Book object**.

**distinguished name (DN):** A name that uniquely identifies an object by using the relative distinguished name (RDN) for the object, and the names of container objects and domains that contain the object. The distinguished name (DN) identifies the object and its location in a tree.

**distribution list:** A collection of users, computers, contacts, or other groups that is used only for email distribution, and addressed as a single recipient.

**Document object:** A **Message object** that represents a single file, such as a document generated by a word-processing application. The Message object contains the file as an **Attachment object** and includes additional properties to describe the file.

**domain:** A set of users and computers sharing a common namespace and management infrastructure. At least one computer member of the set must act as a domain controller (DC) and host a member list that identifies all members of the domain, as well as optionally hosting the Active Directory service. The domain controller provides authentication (2) of members, creating a unit of trust for its members. Each domain has an identifier that is shared among its members. For more information, see [\[MS-AUTHSOD\]](#) section 1.1.1.5 and [\[MS-ADTS\]](#).

**double-byte character set (DBCS):** A character set (1) that can use more than one byte to represent a single character. A DBCS includes some characters that consist of 1 byte and some characters that consist of 2 bytes. Languages such as Chinese, Japanese, and Korean use DBCS.

**Email object:** A **Message object** that represents an email message in a message store and adheres to the property descriptions that are described in [\[MS-OXOMSG\]](#).

**entry ID:** See [EntryID](#).

**EntryID:** A sequence of bytes that is used to identify and access an object.

**Exception Embedded Message object:** An Embedded Message object that contains the changes for an Exception object.

**Exception object:** An instance of a **recurring series** that differs from the rest of the recurring series, for example by start time.

**File Transfer Protocol (FTP):** A member of the TCP/IP suite of protocols that is used to copy files between two computers on the Internet if both computers support their respective FTP roles. One computer is an FTP client and the other is an FTP server.

**flags:** A set of values used to configure or report options or settings.

**folder associated information (FAI):** A collection of **Message objects** that are stored in a Folder object and are typically hidden from view by email applications. An FAI Message object is used to store a variety of settings and auxiliary data, including forms, views, calendar options, favorites, and category lists.

**Folder object:** A messaging construct that is typically used to organize data into a hierarchy of objects containing Message objects and **folder associated information (FAI)** Message objects.

## 1.3 Overview

Each property listing in this document contains a link to the section of the technical specification in the Exchange Server Protocols documentation that acts as the defining reference for the property. The defining reference for each property contains the semantic use and definition of the property, including the property data type. The property information that is included in the defining reference for each property is required to successfully parse property data. As such, this document provides implementers with a single source of navigation to all of the critical property information that is included in the individual Exchange Server Protocols technical specifications.

This document also provides additional information about each property that is helpful to the implementer, such as the functional area where the property is used, a list of all the technical specifications that cite the property, and a list of alternate names by which the canonical property is known within the system. This information is not included in the technical specifications that describe each property, and is unique to this document. It is provided for informational purposes only.

A typical scenario for using this document is when an implementer encounters both **property IDs** and property values with no other identification coming across the wire. The property data type and the semantic definition of the property that are included in the defining reference for each property allow

the implementer to correctly parse property values that show up in **ROP buffers**. The parsed values in the ROP buffers include lists of property IDs, which are typically lists of four hexadecimal characters. By searching the information in this document for those four hexadecimal characters, the implementer can quickly name the associated property and navigate to the definition of the individual property in its defining specification.

The following information is provided for each property, as appropriate.

**Alternate names:** Alternate names are implementation-specific names for properties that are used in source code and non-protocol-related documentation. Information about alternate names is useful when the implementer needs to refer to legacy documentation about a specific canonical property.

**Area:** The functional area where the property is used. Sections [1.3.1](#), [1.3.2](#), and [1.3.3](#) describe the general functional areas where properties are used. The listing for each property in section [2](#) describes the areas with more varied descriptions so as to provide more insight into property usage.

**Canonical name:** The name used to refer to the property in the Exchange Server Protocols documentation. The prefix of the canonical name identifies the basic characteristics of a property to the implementer.

The canonical naming structure uses three categories that are denoted by the following prefixes to the canonical **property name**:

- PidLid prefix: Properties identified by an unsigned 32-bit quantity along with a property set.
- PidName prefix: Properties identified by a string name along with a property set.
- PidTag prefix: Properties identified by an unsigned 16-bit quantity.

**Description:** A brief description of the contents of the property.

**Data type:** The property value type, as described in [\[MS-OXCDATA\]](#), that specifies the type of values allowed for the property.

**Property ID:** An unsigned 16-bit quantity that identifies a **tagged property**. Property IDs are not necessarily unique. With the exception of property IDs in the range from 0x6800 to 0x7BFF (see section 1.3.3), the combination of property ID and data type are unique. Property IDs in the range from 0x6800 to 0x7BFF are defined by the **message class**.

**Property long ID (LID):** An unsigned 32-bit quantity that, along with the **property set**, identifies a **named property**.

**Property name:** A string that, along with the property set, identifies a named property.

**Property set:** A **GUID** that identifies a group of properties with a similar purpose.

**Defining references:** One or more technical specifications that describe the semantics and allowed values for the property.

**Consuming references:** One or more technical specifications that refer to the property but do not describe semantics and allowed values.

### 1.3.1 Common Message Classes

### 1.3.3 Property ID Ranges

The 65,536 possible values of the property ID are divided into sub-ranges reserved for various purposes, as described in the following table.

In this context, the term "non-transmittable" refers specifically to transmission via an email transport protocol (such as **SMTP**), and not to any network transport protocol (such as **TCP**):

- Servers do not allow property IDs in ranges specified as non-transmittable to be submitted for transport to another server via an email transport protocol. Property IDs in ranges not specified as non-transmittable are submitted for transport to another server.

- Clients can use properties in ranges described as message class-defined for application-defined purposes. When doing so, applications specify a value for the **PidTagMessageClass** property (section [2.778](#)) that is distinct from any value listed in section [1.3.1](#).
- Clients can use any named property for application-defined purposes. No constraint is placed on the value of the **PidTagMessageClass** property in this case, but the property set of the named property is distinct from any value listed in section [1.3.2](#). Note that named properties are always transmittable.
- Clients can use properties in ranges specified as transport-defined, but they cannot define new properties in those ranges.
- Clients can use and define properties in ranges specified as user-defined, but need to avoid conflicts with alternate definitions of the same property ID.

### 1.3.4 WebDAV Property Naming

The email server is natively a **Messaging Application Programming Interface (MAPI)** message store where the vast majority of properties in it are MAPI properties. The **WebDAV** implementation uses the **Augmented Backus-Naur Form (ABNF)** notation, as described in [\[RFC5234\]](#), as a way to name MAPI properties, allowing Web Distributed Authoring and Versioning Protocol (WebDAV) clients to work with these properties directly.

The `http://schemas.microsoft.com/mapi/` namespace is used to access MAPI properties directly on the server. The namespace consists of three sub namespaces: proptag, id, and string. The ABNF notation used to specify the format of these namespaces is described in this section.

#### 1.3.4.1 `http://schemas.microsoft.com/mapi/proptag Namespace`

The `http://schemas.microsoft.com/mapi/proptag` namespace is used to access properties on the server that are identified by a property ID. The implementer can access these properties through WebDAV by appending the hexadecimal property ID value and the hexadecimal **property type** value to the namespace prefix.

```
proptag-specifier = "http://schemas.microsoft.com/mapi/proptag/x" property-id property-type
property-id = 4HEXDIG
property-type = 4HEXDIG
```

Example:

```
http://schemas.microsoft.com/mapi/proptag/x0037001f (PidTagSubject)
```

#### 1.3.4.2 `http://schemas.microsoft.com/mapi/id Namespace`

The `http://schemas.microsoft.com/mapi/id` namespace is used to access named properties on the server that are identified by a property **long ID (LID)**. The implementer can access these properties through WebDAV by appending the property set and the hexadecimal property long ID (LID) value to the namespace prefix.

```
id-specifier = "http://schemas.microsoft.com/mapi/id/" property-set "/x" property-long-id
property-set = "{" 8HEXDIG "-" 4HEXDIG "-" 4HEXDIG "-" 4HEXDIG "-" 12HEXDIG "}"
property-long-id = 8HEXDIG
```

Example:

```
http://schemas.microsoft.com/mapi/id/{00062002-0000-0000-C000-000000000046}/x00008213
(PidLidAppointmentDuration)
```

#### 1.3.4.3 `http://schemas.microsoft.com/mapi/string Namespace`

The `http://schemas.microsoft.com/mapi/string` namespace is used to access named properties on the server that are identified by a property name. The implementer can access these properties through WebDAV by appending the property set and the property name to the namespace prefix.

```
string-specifier = "http://schemas.microsoft.com/mapi/string/" property-set "/" property-name
```

```
property-set = "{" 8*HEXDIG "-" 4*HEXDIG "-" 4*HEXDIG "-" 4*HEXDIG "--" 12*HEXDIG "}"  
property-name = 1*CHAR
```

Example:

[http://schemas.microsoft.com/mapi/string/{00020329-0000-0000-C000-000000000046}/Subject\(PidNameSubject\)](http://schemas.microsoft.com/mapi/string/{00020329-0000-0000-C000-000000000046}/Subject(PidNameSubject))

## 1.4 Relationship to Protocols and Other Structures

This document relies on property data type and error code definitions in [\[MS-OXCDATA\]](#). For tables and examples that describe property data types, and property and other error codes, see [\[MS-OXCDATA\]](#).

The list of properties and their descriptions included in this document provide context for many of the data structures described in [\[MS-OXCDATA\]](#).

The description of each property contained in this document relies on the technical specification that is cited as its defining reference.

For conceptual background information and overviews of the relationships and interactions between this and other protocols, see [\[MS-OXPROTO\]](#).

## 1.5 Applicability Statement

This document provides numeric values used to encode property names, tags, and data types in ROP buffers. It also serves as a convenient index to the object type documents that define how each property is used.

## 1.6 Versioning and Localization

None.

## 1.7 Vendor-Extensible Fields

Property ID ranges, as described in section [1.3.3](#), describe how applications choose properties to create new Message object types or to add functionality to existing types.
